DASHBOARD	
Issue:	The Admin, HR Manager, and User profile dropdown menu in the sidebar is not functioning correctly. When clicking Profile, Settings, or Help Center, the buttons do not redirect to their respective pages. Only the Sign Out button works properly. Expected Behavior:	When clicking Profile, Settings, or Help Center, the system should redirect the user to their corresponding pages.
Possible Solution:	- Verify that the routing paths for Profile, Settings, and Help Center are correctly configured. - Check if the click event handlers are properly attached to the buttons. - Ensure the navigation links (href or router links) point to the correct page routes.

ADMIN	
Issue:	**Optional for features in Job Title * Department * Location *** Add a dropdown arrow selection feature for the fields Job Title, Department, and Location to make it easier for users to navigate and select options instead of manually typing the information.

	Expected Behavior:	Each field (Job Title, Department, and Location) should provide a dropdown list of available options. Users can simply click the dropdown arrow and select the appropriate option, which helps ensure consistency and reduces input errors.
Possible Solution:	**Possible Benefit:** - Improves user experience and navigation - Reduces manual typing errors - Ensures standardized data entry across the system - Makes the form faster and easier to complete
Issue:	**Form Allows Navigation Without Completing Required Fields:** The form allows users to proceed to the next page without filling out the required fields on the first page same on other pages: Job Title * Department * Location *. Expected Behavior:	The system should prevent users from proceeding until all required fields marked with * are filled. There should be: - Validation messages indicating which fields are missing. - Users should only be able to move forward after completing the required fields.
Possible Solution:	Implement form validation on the frontend to check required fields before moving to the next page. - Add backend validation to ensure that incomplete submissions cannot be saved.

	- Display clear error messages like: “Job Title is required,” “Department is required,” etc.
Issue	**Job Description:** In the Job Description field, while typing you can press Enter to create new lines, sentences, or paragraphs. However, after saving, the job description does not preserve the formatting and displays everything in a single line.  **View:** Expected Behavior:	The Job Description should display the text exactly as typed, maintaining: - Paragraph breaks - Line breaks - Proper spacing between sentences or sections
Possible Solution:	Store the text with line breaks preserved (e.g., using tags for HTML, or saving as Markdown/HTML). On the frontend, render the saved text in a way that respects line breaks and formatting (e.g., using white-space: pre-line in CSS for plain text, or rendering HTML if stored as HTML). Consider using a rich text editor for Job Description so users can format it with paragraphs, bullets, and bold/italic text, which will then be saved

	and displayed correctly.
Issue	In the Requirements & Qualifications field, the text editor does not allow adding new lines, bullets, or numbered lists. When typing, the text continues on the same line, causing all content to save as a single line.  Expected Behavior:	The Requirements & Qualifications field should support multiline input. Users should be able to: - Press Enter to create a new line. - Use bullet points, dashes, or numbering similar to Google Docs. - Have the saved content maintain proper formatting with line breaks or lists.
Possible Solution:	- Replace the current input with a rich text editor (e.g., Quill, TinyMCE, or CKEditor) to support formatting features like bullets, numbering, and line breaks. - Ensure the backend saves the formatted text (HTML or Markdown) instead of plain text. - Update the display on the frontend to render the saved formatting correctly.
Issue:	When clicking the Edit button for a job, the fields Requirements & Qualifications, Responsibilities, and Application Deadline do not display or are not editable.

	Expected Behavior:	- Load all previously saved job details into the form. - Allow to view and modify all fields, including Requirements & Qualifications, Responsibilities, and Application Deadline.
Possible Solution:	- Ensure the edit form fetches and populates all fields from the database. - Verify that these fields are not disabled or hidden in the edit view. - Confirm that changes made in these fields are properly saved back to the database when updating.
Issue:	**Applicants Status:** Applicants are able to create accounts and apply for jobs, but after applying: - Their application appears as “Pending” in the Applicants list. - There is no option to change the applicant’s status (Pending → In-Process, Accepted, Rejected, Withdrawn). - The application does not reflect in the admin or HR Interview sidebar, so interview progression cannot be tracked. 
	 Expected Behavior:	- After an applicant submits an application, admins/HR should be able to view the application. - Admin/HR should be able to update the applicant's status to any of the available options: Pending, In-Process, Accepted, Rejected, Withdrawn. - Changes in status should reflect immediately for both the applicant and the interview tracking system.
Possible Solution:	- Ensure the applicant application data is correctly saved and synced with the Interview module for admins/HR. - Add functionality for status updates in the admin/HR dashboard for each applicant. - Implement real-time status reflection so applicants and HR/admin can track progress.

HR	
Issue:	**Interviews Navigation:** When an HR Manager reschedules an interview, the interview disappears from the Upcoming Interviews list instead of remaining visible with the updated schedule. Expected Behavior:	After rescheduling, the interview should remain in the Upcoming Interviews tab and display the updated date and time, as long as the new schedule is still in the future.
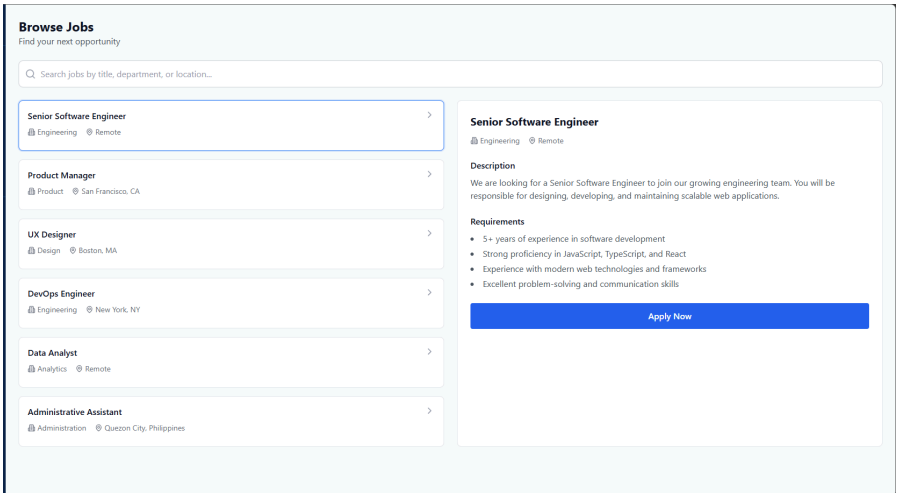
Possible Solution:	Ensure that rescheduling only updates the interview date and time without changing its status. Verify that the system still classifies the interview as Upcoming after the update and that the frontend refreshes or re-fetches the interview list properly. - Ensure the status remains "Upcoming" or "Scheduled" after rescheduling. - Update the backend logic to only modify the date/time fields when rescheduling. - Verify that the frontend filter for upcoming interviews checks if interview_date >= current_date. - Trigger a UI refresh or state update after the reschedule action to correctly display the updated interview.
Issue:	**Applicants Status:** Applicants are able to create accounts and apply for jobs, but after applying: - Their application appears as “Pending” in the Applicants list. - There is no option to change the applicant’s status (Pending → In-Process, Accepted, Rejected, Withdrawn). - The application does not reflect in the admin or HR Interview sidebar, so interview progression cannot be tracked.

	Expected Behavior:	- After an applicant submits an application, admins/HR should be able to view the application. - Admin/HR should be able to update the applicant's status to any of the available options: Pending, In-Process, Accepted, Rejected, Withdrawn. - Changes in status should reflect immediately for both the applicant and the interview tracking system.
Possible Solution:	- Add status action buttons inside the HR/Admin application details modal - Buttons should update the status in real time - Filter counts (Pending, In-Process, Accepted, Rejected, Withdrawn) should reflect changes immediately

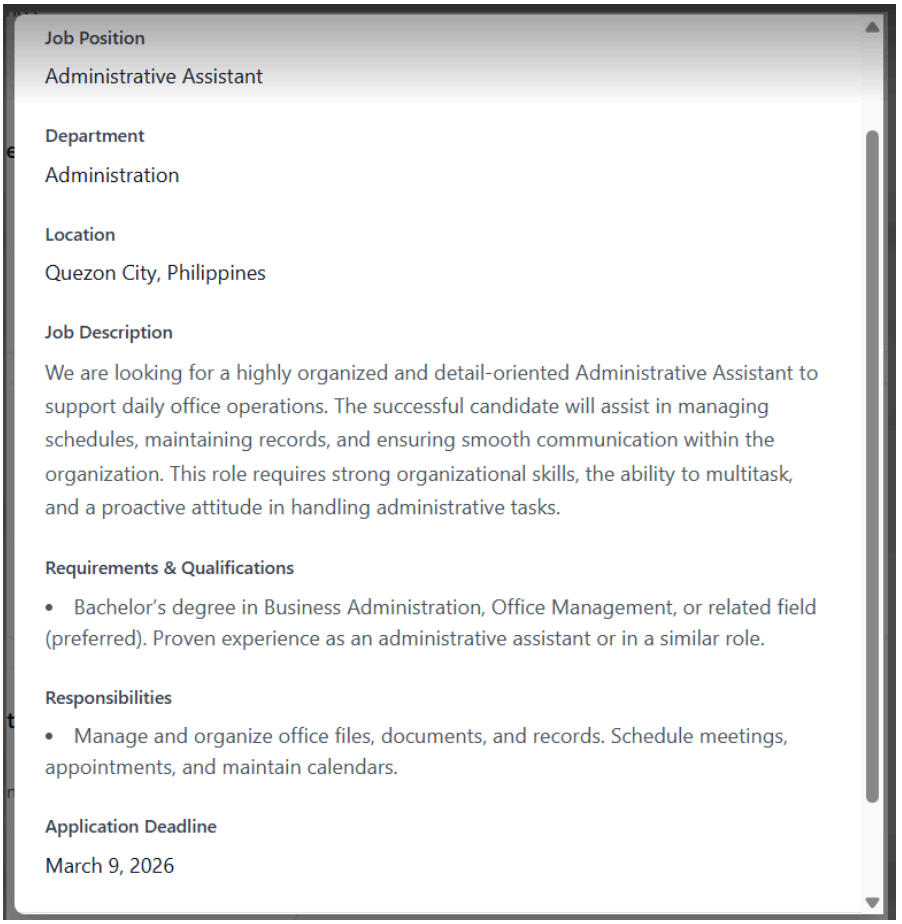
CANDIDATE

Issue:

User:



Admin:



The **Responsibilities field** entered by the **admin** when creating or posting a job is not displayed on the user-side job listing page.

Although the admin panel correctly shows the Responsibilities section, the user interface only displays the Job Position, Department, Location, Job Description and Requirements, causing the responsibilities data to be missing from the user view.

Expected Behavior:	When an admin creates or posts a job with the following fields: ● Job Position ● Department ● Location ● Job Description ● Requirements ● Responsibilities All fields should be stored in the database and displayed consistently on the user-side job details page. Specifically, the **Responsibilities section** should appear below the Requirements section in the user job details panel.

Possible Solution:	● Check Backend Data Retrieval
	  ○ Verify that the backend system retrieves the Responsibilities data when fetching job details. The backend API should include this field when sending job information to the user interface.
	
	● Confirm Database Storage
	  ○ Ensure that the Responsibilities field is correctly stored in the database when the admin submits a job post. If the database schema or structure does not include this field properly, it may not be saved or retrieved.
	
	● Review Frontend Display Logic
	  ○ Check the user-side interface to confirm that it is designed to display the Responsibilities section. It is possible that the frontend only displays certain job fields and does not include the Responsibilities field.
	
	● Check Field Naming Consistency
	  ○ Ensure that the field name used when saving the Responsibilities data matches the field name used when retrieving and displaying it. Any mismatch between the admin input, database field, backend response, and frontend display could cause the data not to appear.
	
	● Test API Response Data
	  ○ Inspect the data returned by the API when loading job details on the user side. If the Responsibilities field is missing in the response, the issue is likely in the backend or database. If it is present but not shown, the issue is likely in the frontend display.

Issue:	 The **application time** displayed on the **admin side is incorrect**. When the user submitted the application at 1:34 PM, the admin panel showed 5:32 AM. While the date is correct, the time is inaccurate, indicating a possible timezone or time conversion issue in the system.
Expected Behavior:	The admin panel should display the exact time when the user submitted the application. If the user submitted the application at 1:34 PM, the admin interface should also show 1:34 PM on the same date.
Possible Solution:	• Ensure that the server timezone and application timezone are consistent (e.g., both set to Philippine Time – UTC+8). • Verify that the timestamp stored in the database is correct and not automatically converted to another timezone (e.g., UTC). • If the backend stores time in UTC, implement proper timezone conversion to Asia/Manila (UTC+8) before displaying it on the admin interface. • Check the frontend formatting logic to ensure it correctly converts and displays the timestamp from the backend. • Use consistent date-time handling libraries (e.g., Day.js, Moment.js, or native Date with timezone support) to prevent incorrect time display.
