System Revision List

Revised specific objectives:

1. To design a system that allows the resume extraction using NLP techniques to analyze candidate data and assist in initial screening and recruitment.

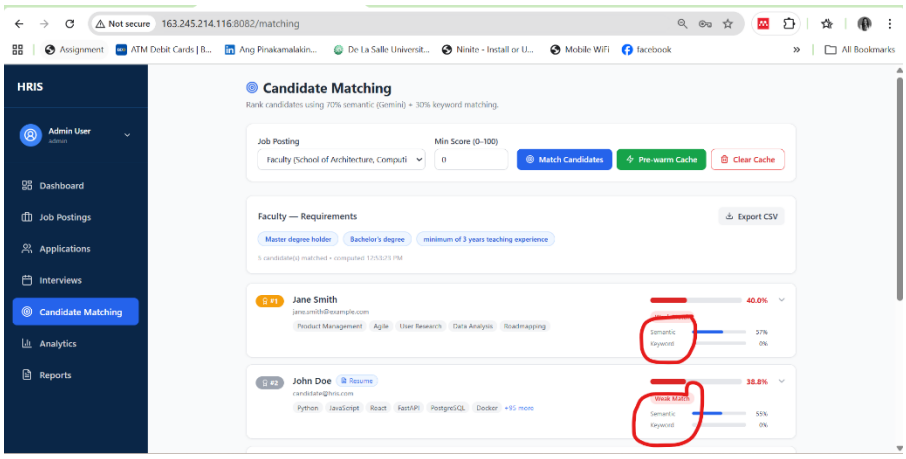
2. To implement job-to-candidate matching by using semantic similarity techniques like BERT embeddings to assess the relevance of applicant profiles to job descriptions.

3. To design an intelligent dashboard that enables HR officers to filter, rank, and review applicants based on extracted metrics and matching scores.

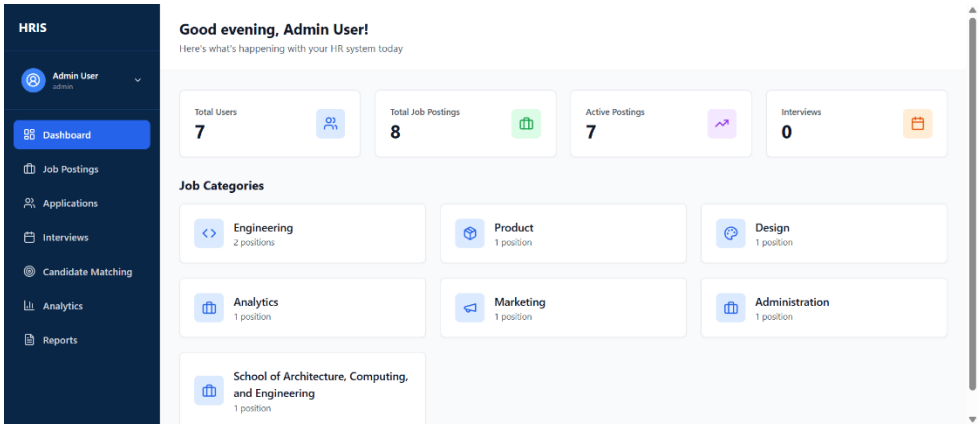
4. To assess the quality and functionality of the developed recruitment system by conducting unit testing and user acceptance testing using the evaluation criteria defined in the ISO/IEC 25010.

Suggestions:

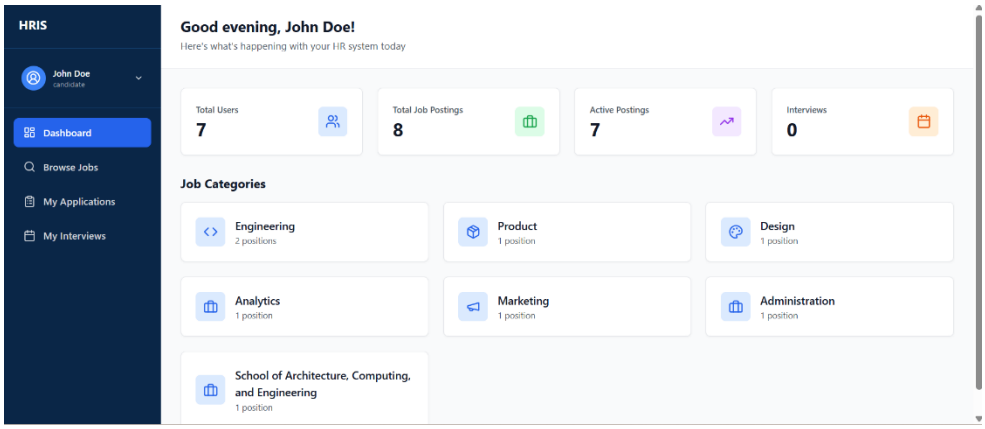
1. Change the word “semantics” to similarity; change the keyword to keyword match



2. (admin) Dashboard – This module displays recruitment phase indicators, including Initial Screening, Teaching Demonstration, Interview, Final Selection, Job Offer, and Onboarding. Each indicator displays the current number of applicants in a specific phase, allowing HR personnel to view the names of candidates associated with each stage of the recruitment process.



Candidate Dashboard – Similar to the HR dashboard, the candidate dashboard allows applicants to view the current stage of the recruitment process where their application is being evaluated.



3. Add colors
